FILTER CLEANING AT ITS BEST

Replacing cylindrical air filters for dust collectors and other sources can be an expensive practice for maintenance professionals.

MTS can provide companies with a fully automatic air filter dry cleaning system that uses computer-controlled sequences of compressed air, vacuum, vibration and rotation to completely clean a dirty air filter. MTS can clean any cylindrical air filter ranging from 7" to 32" in height and possessing inside diameters of 3.5" up to 20" in outside diameter.

Unlike other companies, MTS does not use chemicals or liquids during the cleaning process.

MTS can clean and allow you to reuse air filters found in the following applications:

- Dust / fume collection
- Powder coating booths
- Grinding / blasting booths
- Co-generation
- On & off road equipment
- And more!
